## Feature

- Supports Serial Peripheral Interface with Mode 0 and Mode 3
  - Single SPI (1-1-1, 1-1-2, 1-2-2, 1-1-4, 1-4-4)
  - Dual SPI (2-2-2)
  - Quad SPI (4-4-4)
- Operating Frequency
  - Single Data Rates (SDR) : 108MHz
  - Double Data Rates (DDR) : 54MHz
- Supports XIP for read and write operations
- Fast write time and single byte writable
- Data protection
  - WP pin write protection
  - Block lock protection
- Nonvolatile status and configuration registers
- Identification
  - 64-bit unique ID
  - 64-bit serial number - user writable
- Augmented 256-byte nonvolatile-area
  - Read and write with user-protection
- Deep power down for low-power
- Supports JEDEC reset
- Memory cell : STT-MRAM
- Density
  - 16Mb, 8Mb, 4Mb, 2Mb and 1Mb
- Data Integrity : No external ECC required
- Data Endurance
  - Unlimited read cycle
  - 10<sup>14</sup> write cycles
- Data Retention
  - 10 years at 85°C
- Single Power Supply Operation
  - S3Axx04V0M: 2.70V~3.60V
  - S3Axx04R0M: 1.71V~1.98V
- Operating Temperature Range
  - Commercial Temperature : 0°C to 70°C
  - Industrial Temperature : -40°C to 85°C
- RoHS compliant packages
  - 8pad WSON (5.0mm x 6.0mm)
  - 8pin SOIC (150mil)

## General Description

The device is a Spin-Transfer-Torque Magneto-resistive Random Access Memory (STT-MRAM). It features a SPI bus interface, XIP(execute-in-place) functionality, and hardware/software based data protection mechanisms. SPI (Serial Peripheral Interface) is a synchronous serial communication interface with command, address and data signals.

It requires less pin counts than parallel interface and is easy to be configured on the system. The device is offered in density ranging from 1Mbit to 16Mbit. The device can replace Flash, FRAM or (nv)SRAM with same functionality and non-volatility.

The device provides various SPI modes to allow options for bandwidth expansion.

SSPI (Single SPI) modes has single(1) pin for command signals. And user can select an option for how many pin to be allocated to address and data signals among 1 pin, 2 pins or 4 pins.

DSPI (Dual SPI) modes provides dual(2) pins for command, address and data signals.

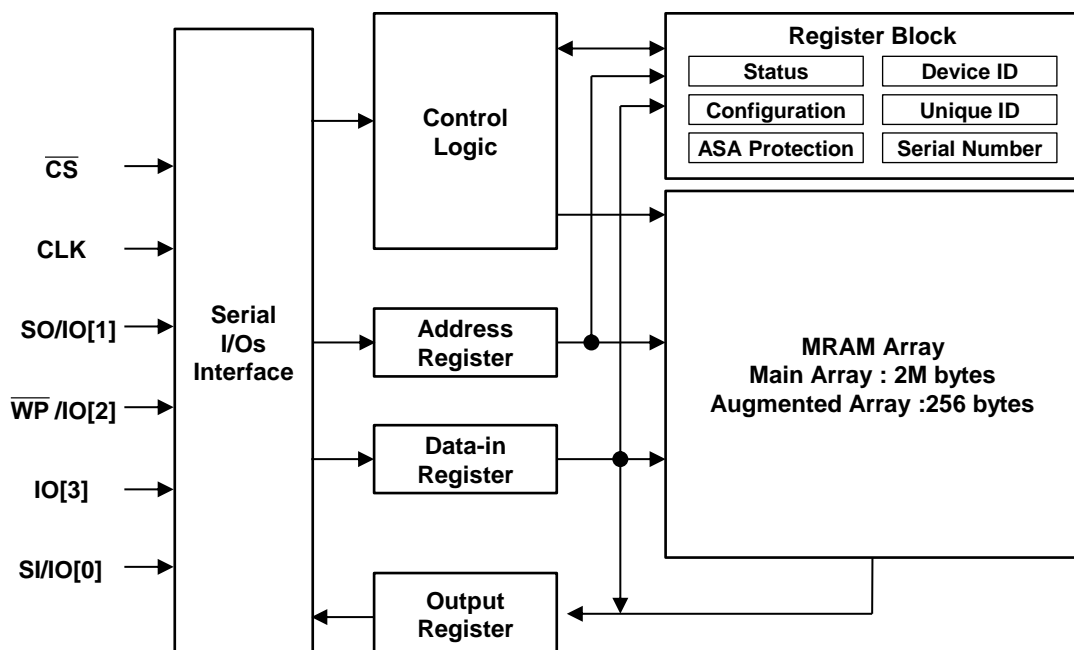

QSPI (Quad SPI) modes provides Quad(4) pins for command, address and data signals.

The device has nonvolatile register bits – status register, configuration register, serial number register, augmented 256 bytes and protection register for augment bytes. These register bits are required to be set at least once on power-up after high temperature solder reflow process.

The device is available in small footprint 8-pad WSON and 8-pin SOIC packages. These packages are compatible with similar low-power volatile and non-volatile products.

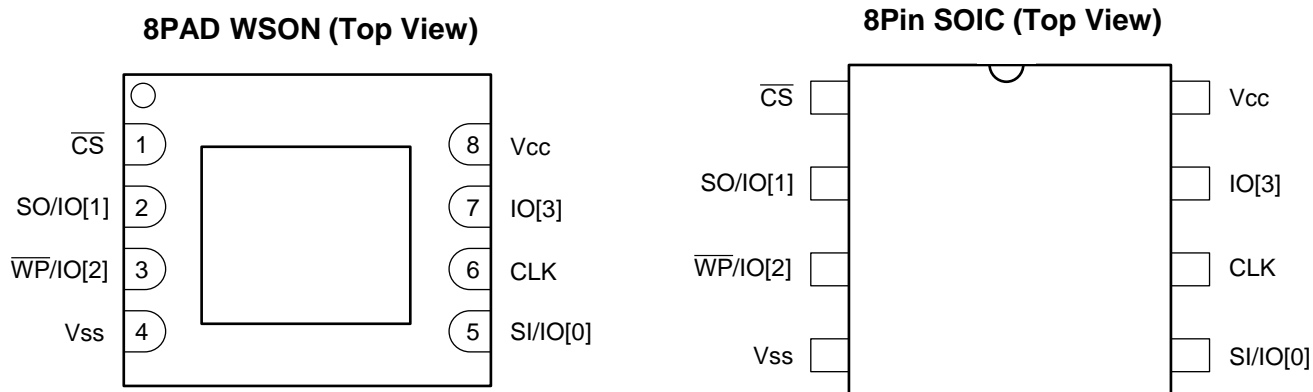

The device is offered with Commercial (0°C to 70°C) and industrial (-40°C to 85°C) operating temperature range.

## Pin Description

**Table 1 : Pin Description**

Pin	Type	Description
$\overline{CS}$	Input	<b>Chip Select:</b> When $\overline{CS}$ is driven Low, read or write operation are initiated. When $\overline{CS}$ is driven High, the device enters standby mode, and all other input pins are ignored and the output pins are tri-stated. $\overline{CS}$ should be High at power-up to prevent abnormal write operation. This pin does not have internal pullup resistor.
CLK	Input	<b>Clock:</b> In SDR(single data rate) mode, command, address and data inputs are latched on the rising edge of the clock. Data is output on the falling edge of the clock. In DDR(double data rate) mode command is latched on the rising edge of the clock and address and data inputs are latched on the rising and falling edges of the clock. Similarly, Data is output on both edges of the clock.  The two SPI clock modes are supported as follows. <ul style="list-style-type: none"> <li>• SPI Mode 0 : SDR and DDR</li> <li>• SPI Mode 3 : SDR only</li> </ul>
$\overline{WP}$ /IO[2]	Input /Bidirectional	<b>Write Protect (SSPI/DSPI):</b> Write protects the status register in conjunction with the WREN bit (SR[1]) of the status register. The writing of status register is protected in related with $\overline{WP}$ and WPEN. See “Table 14 : Write Protection Modes”. This pin does not have internal pullups, it cannot be left floating and must be driven. $\overline{WP}$ is valid in Single SPI and Dual SPI mode. <b>IO[2] :</b> The bidirectional I/O in Quad SPI mode.
IO[3]	Bidirectional	<b>IO[3] :</b> The bidirectional I/O in Quad SPI modes.
SI/IO[0]	Input /Bidirectional	<b>SI :</b> The serial input in Single SPI mode. <b>IO[0] :</b> The bidirectional I/O in Dual and Quad SPI modes
SO/IO[1]	Output /Bidirectional	<b>SO :</b> The serial data output in Single SPI mode. <b>IO[1] :</b> The bidirectional in Dual and Quad SPI modes.
Vcc	Supply	Power pin
Vss	Supply	Ground pin

## Power On/Off Sequence : 3.3V Device

- When power-up, power-down or power-loss,  $\overline{CS}$  must follow  $V_{cc}$  to provide data protection.
- It is recommended that  $\overline{CS}$  must follow  $V_{cc}$  when  $V_{cc}$  is below  $V_{cc}(\text{minimum})$  and during  $t_{PU}$ .
- A 10K $\Omega$  pull-up resistor between  $V_{cc}$  and  $\overline{CS}$  pin is recommended.
- Normal operation must start after  $t_{PU}$ .

Figure 3 : Power-up/down Behavior : 3.3V Device

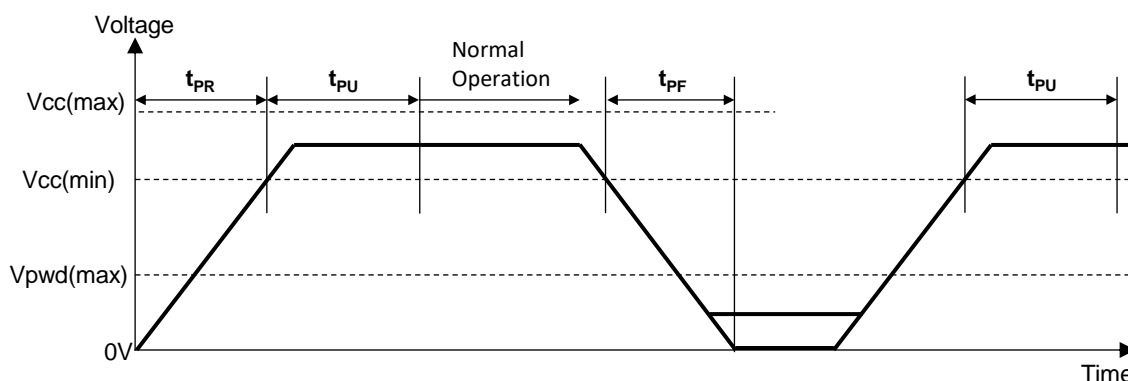

Table 2 : Power Up/Down Timing – 3.3V Device

Parameter	Symbol	Min	Max	Units
Vcc Range	Vcc	2.7	3.6	V
Vcc rising time	$t_{PR}^{(1)}$	30	-	$\mu\text{s/V}$
Vcc falling time	$t_{PF}^{(1)}$	30	-	$\mu\text{s/V}$
Vcc(min) to $\overline{CS}$ Low (first instruction) time	$t_{PU}^{(1)}$	2.0	-	ms
Vcc needed to below Vpwd for ensuring initialization will occur	$V_{PWD}^{(1)}$	-	1.6	V

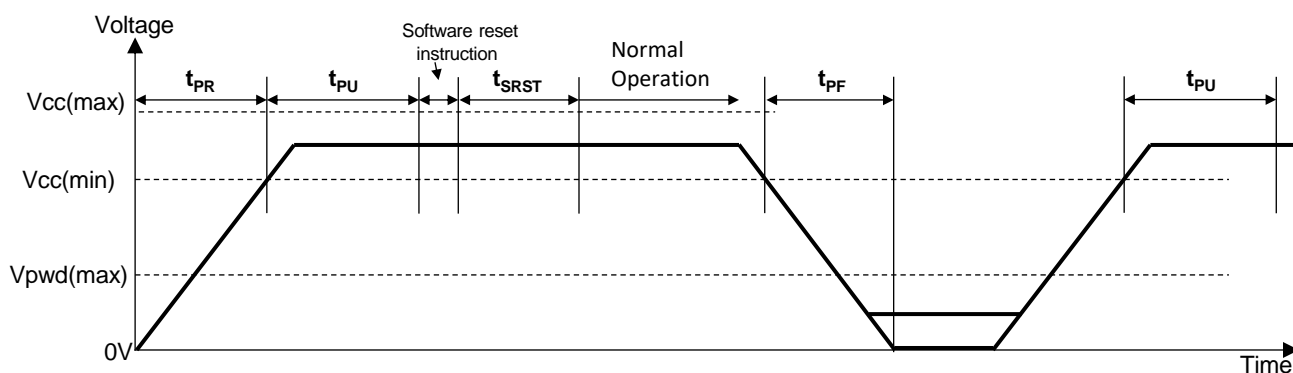

**Notes:**

1: These parameters are guaranteed by characterization; not tested in production.

## Power On/Off Sequence : 1.8V Device

- When power-up, power-down or power-loss,  $\overline{CS}$  must follow  $V_{CC}$  to provide data protection.
- It is recommended that  $\overline{CS}$  must follow  $V_{CC}$  when  $V_{CC}$  is below  $V_{CC}(\text{minimum})$  and during  $t_{PU}$ .
- A 10K $\Omega$  pull-up resistor between  $V_{CC}$  and  $\overline{CS}$  pin is recommended.
- Software reset operation is required after  $t_{PU}$ .
- Normal operation must start after  $t_{SRST}$ .

**Figure 4 : Power-up/down Behavior : 1.8V Device**

## Memory Organization

### Memory Map

**Table 4 : Memory Map**

Density	Address Range	24-bit Address [23:0]	
1Mb	000000h – 01FFFFh	[23:17] – Logic '0'	[16:0] – Addressable
2Mb	000000h – 03FFFFh	[23:18] – Logic '0'	[17:0] – Addressable
4Mb	000000h – 07FFFFh	[23:19] – Logic '0'	[18:0] – Addressable
8Mb	000000h – 0FFFFFFh	[23:20] – Logic '0'	[19:0] – Addressable
16Mb	000000h – 1FFFFFFh	[23:21] – Logic '0'	[20:0] – Addressable

### Augmented 256-Byte Area Map

**Table 5 : Augmented 256-Byte Area Map**

Density	Address Range	24-bit Address [23:0]	
1Mb~16Mb	000000h – 0000FFh <sup>1</sup>	[23:8] – Logic '0'	[7:0] - Addressable

**Notes:**

- 1: The augmented 256-byte area is divided into 8 individually readable and writeable sections (32 bytes per section). After an individual section is written, it can be write protected for each section to prevent further writing.

### Register Address Map

The device provides the register read/write instructions to read and write data of each register. In addition, the device provides the register read and/or write function based on addresses by RDAR(65h) and WRAR(71h) commands.

**Table 6 : Register Address**

Register Name	Address
Status Register	0x000000h

Software Reset Enable	SRTE	66	1-0-0, 2-0-0, 4-0-0		SDR			108MHz
Software Reset*	SRST	99	1-0-0, 2-0-0, 4-0-0		SDR			108MHz

**Notes:**

- 1: Software Reset (SRST) requires Software Reset Enable (SRTE) implemented in advance.
- 2: SSPI mode is enabled after power-on, software reset or JEDEC reset.

Read Any Register - Address Based	RDAR	65	1-1-1, 2-2-2, 4-4-4		SDR	1,4,8	O	108MHz

**Notes:**

1. Registers do not wrap data during reads. Reading beyond the specified number of bytes will yield indeterminate data.

**Table 9 : Write Register Instruction Set**

Instruction Name	Command	Opcode (Hex)	Interface Type (CMD-ADDR-Data)	XIP	Data Rate	Data Bytes	Latency Cycles	Max. Frequency

Write Any Register - Address Based	WRAR	71	1-1-1, 2-2-2, 4-4-4		SDR	1,8		108MHz

**Notes:**

1. Write Enable (WREN) should be implemented in advance of Write Register Instruction set regardless of CR4[1:0] setting.
2. The WREN prerequisite for write operation of memory array and augmented 256-byte area is described in Configuration Register 4.

## Register Description

### Status Register / Device Protection Register

The device offers both hardware and software based data protection schemes. Hardware protection is through  $\overline{WP}$  pin. Software protection is controlled by configuration bits in the Status register. Both schemes inhibit writing to the registers and memory array. Status Register contains options for enabling/disabling data protection. By controlling configuration bits in Status Register, use can protect data in memory array based on software protection schemes.

**Table 13 : Status Register-Data Protection**

Bits	Name	Read/Write	Default State	Description
SR[7]	WPEN	R/W	-	Hardware Based $\overline{WP}$ Protect Bit 1: Protection Enabled – write protects when $\overline{WP}$ is Low 0: Protection Disabled – Doesn't write protect when $\overline{WP}$ is Low
SR[6]	SNPEN	R/W	-	Serial Number Protect Bit 1: Serial Number Write protected 0: Serial Number Writable
SR[5]	TB	R/W	-	Top/Bottom Memory Array Protect Selection 1: Bottom Protection Enabled (Lower Address Range) 0: Top Protection Enabled (Higher Address Range)
SR[4]	BP[2]	R/W	-	Block Protection Bits
SR[3]	BP[1]	R/W	-	
SR[2]	BP[0]	R/W	-	
SR[1]	WREN	R	0	Write Protection Enable 1: Write Operation Protection Disabled 0: Write Operation Protection Enabled
SR[0]	RSVD	R	-	Reserved for future use

Note : SR[7:2] are nonvolatile bits.

### Write Protection Modes

WPEN bit (SR[7]) is used in conjunction with the WREN bit (SR[1]) and the  $\overline{WP}$  pin to provide hardware block protection. SR[7:2] will remain set from the nonvolatile registers whenever the power is on. The WREN bit is volatile and set “1” by the Write Enable command. It is set to “0” at power up. The device enters hardware protection when the  $\overline{WP}$  input is low and the Status Register WPEN bit is set to 1, and the status and configuration register bits can not be changed. The device exits from hardware protection when the  $\overline{WP}$  pin goes high or WPEN bit is set to 0, and the register bits can be changed.

**Table 14 : Write Protection Modes**

WREN	WPEN	WP (Pin)	Status & Configuration Registers	Memory <sup>1</sup> Array Protected Area	Memory <sup>1</sup> Array Unprotected Area
0	X	X	Protected	Protected	Protected
1	0	X	Unprotected	Protected	Unprotected
1	1	0	Protected	Protected	Unprotected
1	1	1	Unprotected	Protected	Unprotected

**Notes:**

1: Memory address range protection based on Block Protection Bits

2. X: Don't Care – Can be Logic '0' or '1'

3. Protected: Write protected, Unprotected: Writable

## Block Protection Modes

The write protection blocks for the memory array are determined by the status register bits (TB and BP[2:0]) as Table 15. TB and BP[2:0] can be modified by WRSR command when the WP input is high or the Status Register WPEN bit is set to 0, and MAPLK(CR1[2]) is set to 0.

## Augmented 256-Byte Area Protection

Augmented 256-Byte Area Protection register contains options for enabling/disabling data protection for eight 32-byte sections.

**Table 16 : Augmented 256-Byte Area Protection Register – Read and Write**

Bits	Name	Address Range	Read/Write	Default State	Description
ASP[7]	ASPS[7]	0000E0h – 0000FFh	R/W	0	1: Protection Enabled 0: Protection Disabled

ASP[0]	ASPS[0]	000000h – 00001Fh	R/W	0	

Note : ASP[7:0] are nonvolatile bits.

## Configuration Register 1 (Read/Write)

Configuration Register 1 controls locking/unlocking data protection options set in the Status register. Once locked, the protection options cannot be changed in the Status register.

**Table 17 : Configuration Register 1 – Read and Write**

Bits	Name	Read/Write	Default State	Selection Options

Note : CR1[7:0] are nonvolatile bits.

## Configuration Register 2 (Read/Write)

Configuration Register 2 controls the interface type along with memory array access latency.

**Table 18 : Configuration Register 2 – Read and Write**

Bits	Name	Read/Write	Default State	Description
CR2[7]	RSVD	R/W	-	Reserved for future use

**Notes:**

1. Read Latency is frequency dependent.
2. Read(03h) does not depend on Read latency Selection Bits, CR2[3:0].
3. CR2[7,5,3:0] are nonvolatile bits.

**Table 19 : Read Latency Cycles vs. Maximum Frequency (Memory Area)**

Read Type	Data Rate	XIP	Latency Cycles	Max Frequency

**Notes:**  
 1. Read(03h) does not depend on Read latency Selection Bits, CR2[3:0]. The latency of Read(03h) is always 0-cycle.

**Table 20 : Read Latency Cycles vs. Maximum Frequency (Augmented 256-Byte Area)**

Read Type	Data Rate	XIP	Latency Cycles	Max Frequency

4-4-4 (RDAR 65h)	SDR	-	2	108MHz

**Notes:**  
 1. RDAR(65h, read any register instruction) does not depend on Read latency Selection Bits, CR2[3:0].

## Configuration Register 3 (Read/Write)

Configuration Register 3 controls the output driver strength along with the boundary size of read data wrapping.

**Table 22 : Configuration Register 3 – Read and Write**

Bits	Name	Read/Write	Description
CR3[7]	DRV[2]	R/W	Output Driver Strength Selection DRV[2:0] 3.3V      1.8V 000: 36Ω    35Ω 001: 100Ω   95Ω 010: 75Ω    63Ω 011: 60Ω    50Ω 100: 48Ω    40Ω 101: 41Ω    30Ω 110: 29Ω    26Ω 111: 24Ω    22Ω

CR3[1]	WRPL[1]		
CR3[0]	WRPL[0]		

**Notes:**

1. Default output strength is DRV[2:0]=000.
2. CR3[7:0] are nonvolatile bits.

	Description
WRPEN(CR3[4]) =Low	Read and write operation : continuous mode Read or write operation starts at the input address, and once the address reaches the maximum address boundary, it automatically returns to minimum address(000000h) until CS goes to high.
WRPEN(CR3[4]) =High	Read operations : wrap mode Read wrap mode is enabled when WRPEN(CR3[4]) is High, and the read data wrap length is controlled by WRPL[2:0]. The output data starts at the input address, data are output sequentially. Once it reaches the ending boundary, the output will wrap around to the beginning boundary automatically until CS is pulled high.  Write operation : continuous mode Write operation starts at the input address, and once the address reaches the maximum address boundary, it automatically returns to minimum address(000000h) until CS goes to high.

## Configuration Register 4 (Read/Write)

Configuration Register 4 controls Write Enable protection (WREN – Status Register) reset functionality during memory array writing<sup>1</sup>. This functionality makes SPI MRAM compatible to other SPI devices.

**Table 23 : Configuration Register 4 – Read and Write**

Bits	Name	Read/Write	Default State	Selection Options
CR4[7:2]	RSVD	R/W	-	Reserved for future use
CR4[1]	WRENS[1]		-	00: Normal: WREN is prerequisite to all Memory Array and Augmented 256-byte Area Write instruction. (WREN is reset after $\overline{CS}$ goes High) 01: SRAM: WREN is not a prerequisite to Memory Array and Augmented 256-byte Area Write instruction (WREN is ignored)
CR4[0]	WRENS[0]		-	10: Back-to-Back: WREN is prerequisite to only the first Memory Array Write or Augmented 256-byte Area instruction. WREN disable instruction must be executed to reset WREN. (WREN does not reset after $\overline{CS}$ goes High) 11: Reserved

**Notes:**

1. Write Enable protection (WREN – Status Register) for Registers is maintained irrespective of the Configuration Register 4 settings. In other words, all register write Instructions require WREN to be set and WREN resets once  $\overline{CS}$  goes High for the write instruction.

CR4[1:0] only affects the writing for memory and augmented 256-bytes area.

2. CR4[7:0] are nonvolatile bits.

## Device Identification Register (Read Only)

Device identification register contains Netsol's Manufacturing ID along with device configuration information.

**Table 24 : Device Identification Register – Read Only**

Bits	Manufacturer ID	Device Configuration

## Serial Number Register (Read/Write)

The device provides 64-bits Serial Number register and the user can write it.

**Table 25 : Serial Number Register – Read and Write**

Bits	Name	Description	Read/ Write	State
SN[63:0]	SN	Serial Number Value	R/W	User writable

**Notes:**

1: Serial Number Bits are nonvolatile and user should write the data after solder reflow process.

## Unique Identification Register (Read Only)

Unique Identification register contains a number unique to every device.

**Table 26 : Unique ID Register – Read Only**

Bits	Name	Description	Read/ Write	Selection Options
UID[63:0]	UID	Unique Identification Number Value	R	Value stored is written in the factory and is device specific

## Device Operation

### General Operation

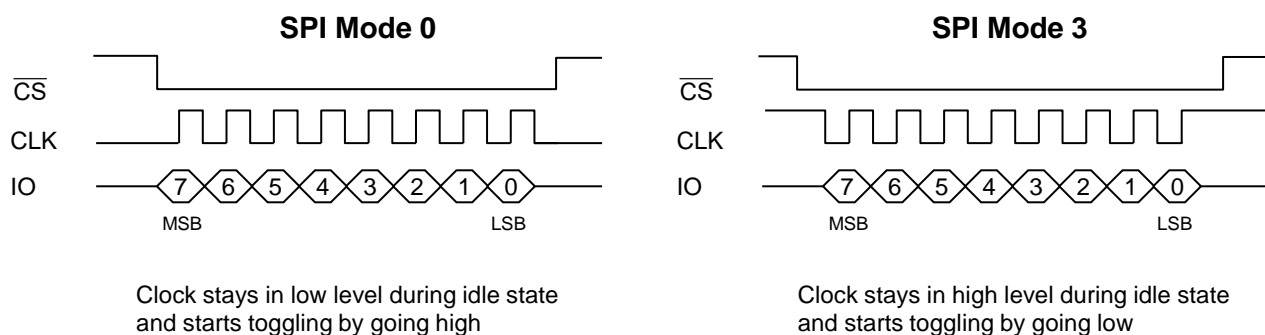

Before a instruction is issued, status register should be checked to ensure device is ready for the intended operation. When correct command is input to this device, it enters active mode and remains in active mode until next  $\overline{CS}$  rising edge.

Do not enter an invalid opcode(except instruction set). When  $\overline{CS}$  goes to high, the device enters standby mode. All communication between a host and the device is in the form of commands. commands define the operation that must be executed. Instruction consist of a command followed by an optional address modifier and data transferred. All command, address and data information is transferred sequentially.

### SPI Clock Modes

- The following two SPI clock modes are supported.
  - SPI Mode 0 (CPOL = 0, CPHA = 0) – SDR and DDR
  - SPI Mode 3 (CPOL = 1, CPHA = 1) – SDR only

**Figure 5 : SPI Clock Modes**

## SPI Interface Modes

- The device supports 3 categories of SPI interface modes.
  - Single SPI (SSPI) : command is transferred through one I/O pin.
    - 1) Address and data are transferred through one pin
    - 2) Address is transferred through one pin, data is transferred through two pins
    - 3) Address is transferred through one pin, data is transferred through four pins
    - 4) Address and data are transferred through two pins
    - 5) Address and data are transferred through four pins
  - Dual SPI (DSPI) : All command, address and data are transferred through two I/O pins.
  - Quad SPI (QSPI) modes : All command, address and data are transferred through four I/O pins.
  
- Nomenclature adoption: A typical SPI instruction consists of command, address and data components. The bus width to transmit these three components varies based on the SPI interface mode selected. To accurately represent the number of I/Os used to transmit these three components, a nomenclature (command-address-data) is adopted and used throughout this document. Integers placed in the (command-address-data) fields represent the number of I/Os used to transmit the particular component. As an example, 1-1-1 means command, address and data are transmitted on a single I/O (SI / IO[0] or SO / IO[1]). On the other hand, 1-4-4 represents command being sent on a single I/O (SI / IO[0]) and address/data being sent on four I/Os (IO[3:0]).

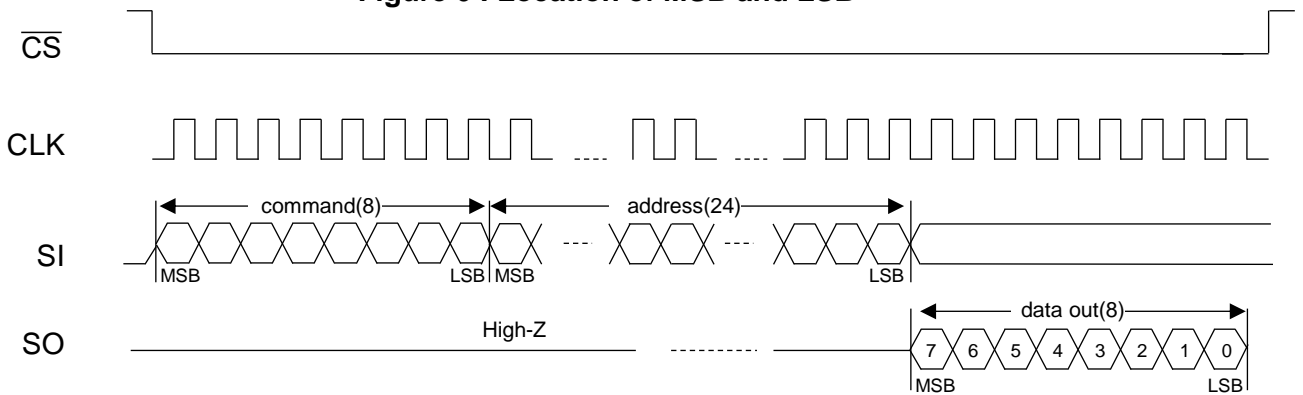

**Table 27 : Pin Assignment / Interface Modes**

Instruction Component	Interface Modes (Command-Address-Data)						
	SSPI 1-1-1	SSPI 1-1-2	SSPI 1-2-2	DSPI 2-2-2	SSPI 1-1-4	SSPI 1-4-4	QSPI 4-4-4
Command	SI/IO[0]	SI/IO[0]	SI/IO[0]	IO[1:0]	SI/IO[0]	SI/IO[0]	IO[3:0]
Address	SI/IO[0]	SI/IO[0]	IO[1:0]	IO[1:0]	SI/IO[0]	IO[3:0]	IO[3:0]
Data Input	SI/IO[0]	IO[1:0]	IO[1:0]	IO[1:0]	IO[3:0]	IO[3:0]	IO[3:0]
Data Output	SO/IO[1]	IO[1:0]	IO[1:0]	IO[1:0]	IO[3:0]	IO[3:0]	IO[3:0]

### MSB/LSB Location in data bits

- The most significant bit(MSB) is placed first at all commands, address and data.

**Figure 6 : Location of MSB and LSB**

- For Dual SPI and Quad SPI, the order of data bits is alternately decided among the IO pins.

**Figure 7 : MSB and LSB in DSPI and QSPI**

#### 1) Dual SPI

#### 2) Quad SPI

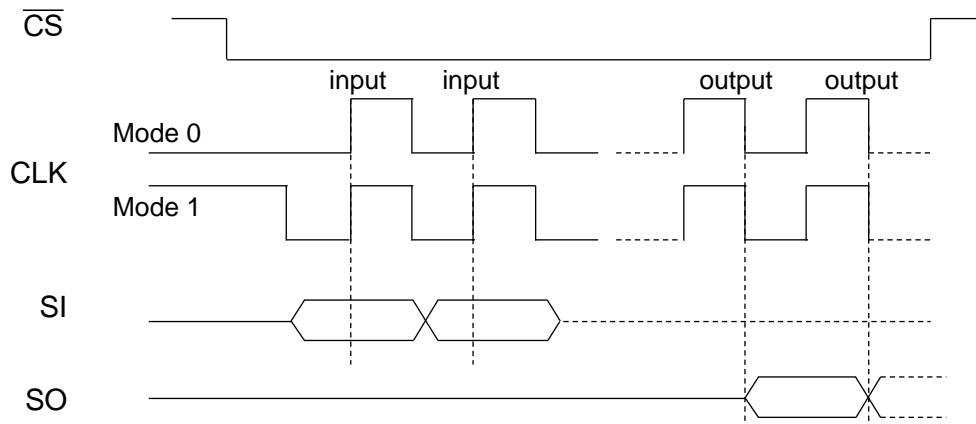

\* Note;  
All commands, Address, XIP and Data follow this order

## Data Rate (SDR/DDR)

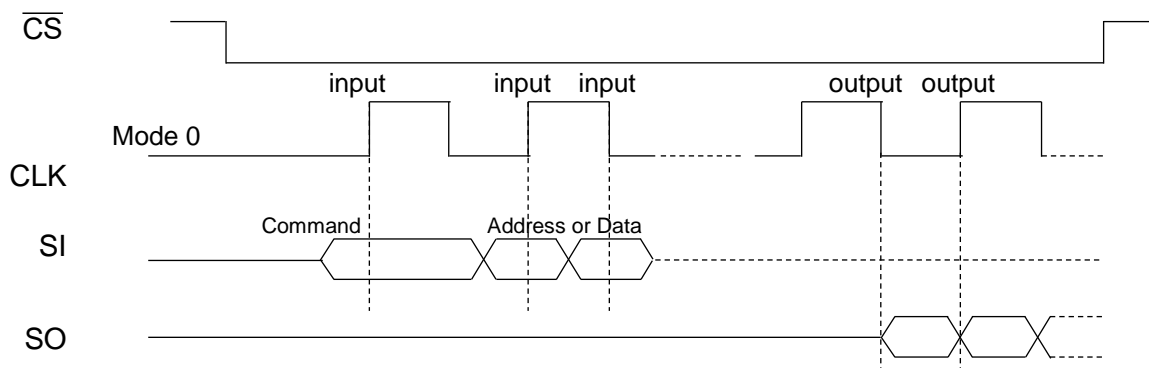

- In Single Data Rate mode (SDR), command, address and data inputs are latched on the rising edge of the clock. Data is outputted on the falling edge of the clock.

**Figure 8 : Description of SDR Instruction Type**

- In Double Data Rate mode (DDR), command is latched on the rising edge of the clock. Address and Data inputs are latched on both edges of the clock. Data is output on both edges of the clock.

**Figure 9 : Description of DDR Instruction Type**

## Instruction Structure

- Each instruction starts out with an 8-bit command. The command selects the type of operation. The instruction can be stand alone or followed by address to select a memory location or register. The address is always 24-bits wide.

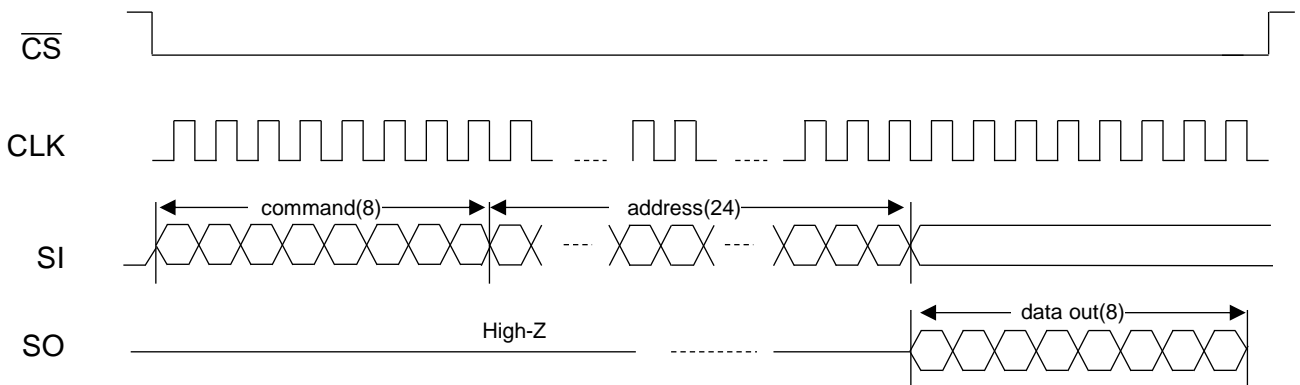

**Figure 10 : Description of command followed by Address (SSIP mode)**

## Read Operation

- Read operation starts from pulling  $\overline{CS}$  Low. 8 bits Read command(03h) is transmitted to the device then 24 bit address is following while the first 7 MSB bits of address are don't care. The device outputs the data at selected address to the SO pin. The read operation can be terminated by pulling  $\overline{CS}$  high.

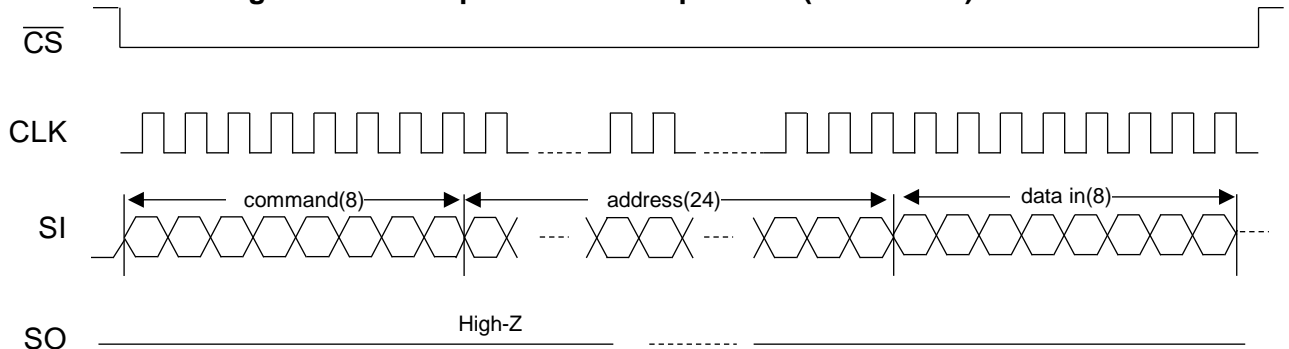

**Figure 11 : Description of Read Operation (SSIP mode)**

## Write Operation

- Write operation starts from pulling  $\overline{CS}$  Low. 8 bits Write command(02h) is transmitted to the device then 24 bit address is following while the first 7 MSB bits of address are don't care. The data on the SI pin is written to the device at selected address. The write operation can be terminated by pulling  $\overline{CS}$  high.

**Figure12 : Description of Write Operation (SSPI mode)**

\* Note :

In normal operational mode, Write instructions must be preceded by the WREN command. WREN command sets the WREN bit in the Status register. WREN bit is reset at the end of every Write instruction. WREN bit can also be reset by executing the WRDI command.

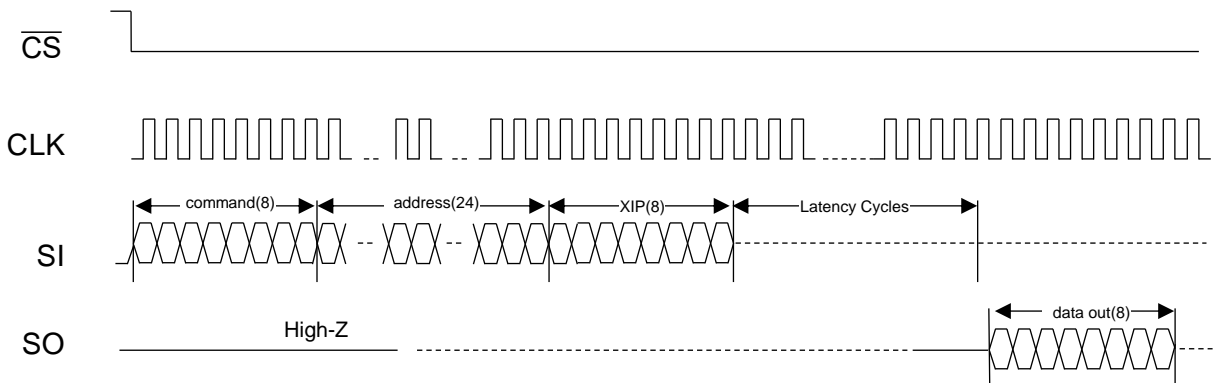

The device offers two other modes, namely SRAM and Back-to-Back Write where WREN does not get reset after a write instruction to the memory array or the augmented 256-byte area. These modes are set in Configuration Register 4.

## XIP (Execute In Place) Operation

- For read and write operation, the device offers XIP (execute in place) mode. XIP allows a series of read or write operation without loading individual read or write command for each instruction, which results in reduced random access time. XIP is enabled by entering byte AXh and disabled by entering any byte not equal to AXh. These respective bytes must be entered following the address

bits. Read operation with XIP needs extra Read-Latency before data coming out from SO pin. The latencies are specified in Table 19 : Memory Array Read Latency Cycles vs. Maximum Clock Frequency (with XIP) .

**Figure 13 : Description of Read Operation with XIP (SSIP mode)**

## Continuing Read/Write

- The entire memory array can be read from or written to using a single read or write instruction. After the starting address is entered, subsequent address are internally incremented as long as  $\overline{CS}$  is Low and CLK continues toggling.

**Figure 14 : Description of Continuing Read Operation (SSIP mode)**

**Figure 15 : Description of Continuing Write Operation (SSIP mode)**

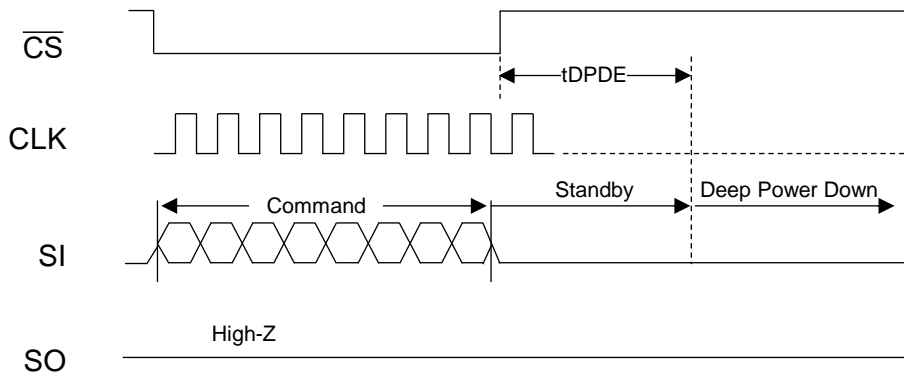

- For read operation, the device offers wrap mode. Wrap bursts are confined to address aligned 16/32/64/128/256/512/1K byte boundary. The read address can start anywhere within the wrap boundary. 16/32/64/128/256/512/1K wrap configuration is set in Configuration Register 3.

## Deep Power Down Modes

- The device provides Deep Power Down mode. This mode reduces current consumption from ISB to IDPD.

To enter the deep power down mode,  $\overline{CS}$  is driven low, following the enter Deep Power Down (DPDE) command,  $\overline{CS}$  must be driven high after the eighth bit of the command code has been latched in or the DPDE command will not be executed. After  $\overline{CS}$  is driven high, it requires a delay of  $t_{DPDE}$  before the supply current is reduced to IDPD and the Deep Power Down mode is entered. The command can be issued in SPI, DSPI or QSPI modes.

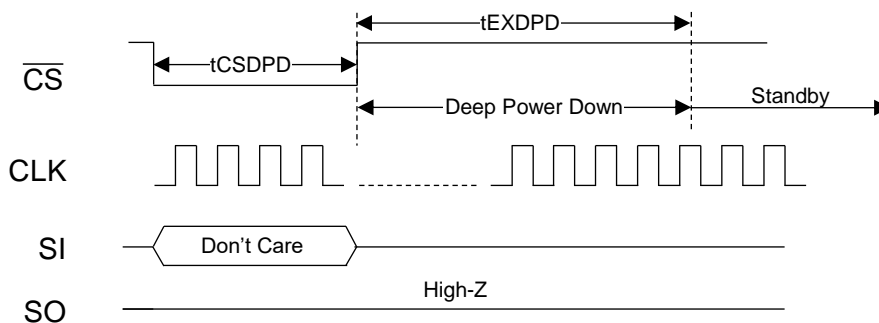

**Figure 16 : Entering Deep Power Down Mode (SSIP mode)**

- There are two ways to exit deep power down mode:

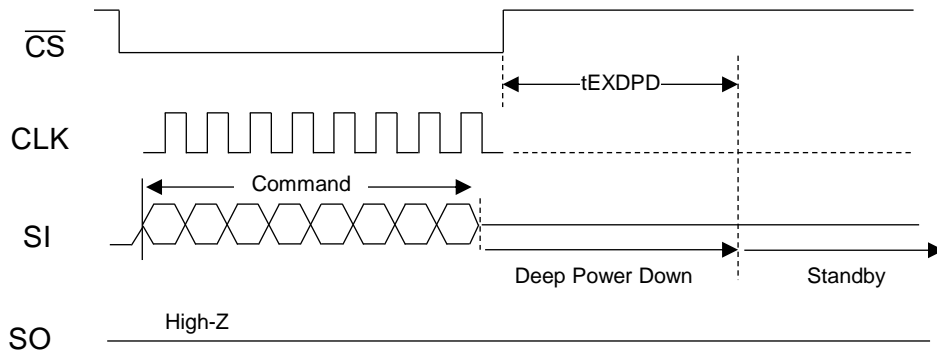

1. Toggling  $\overline{CS}$  with a  $\overline{CS}$  pulse width of  $t_{CSDPD}$  while CLK and I/Os are Don't Care. During waking up from deep power down, I/Os remain to be in high-Z.

**Figure 17 : Exit Deep Power Down Mode by  $\overline{CS}$**

2. Driving  $\overline{CS}$  low follows with the Exit Deep Power Down (EXDPD, ABh) command.  $\overline{CS}$  must be driven high after the eight bit of the command code has been latched in or the EXDPD command will not executed.

**Figure 18 : Exit Deep Power Down Mode by SPI Command**

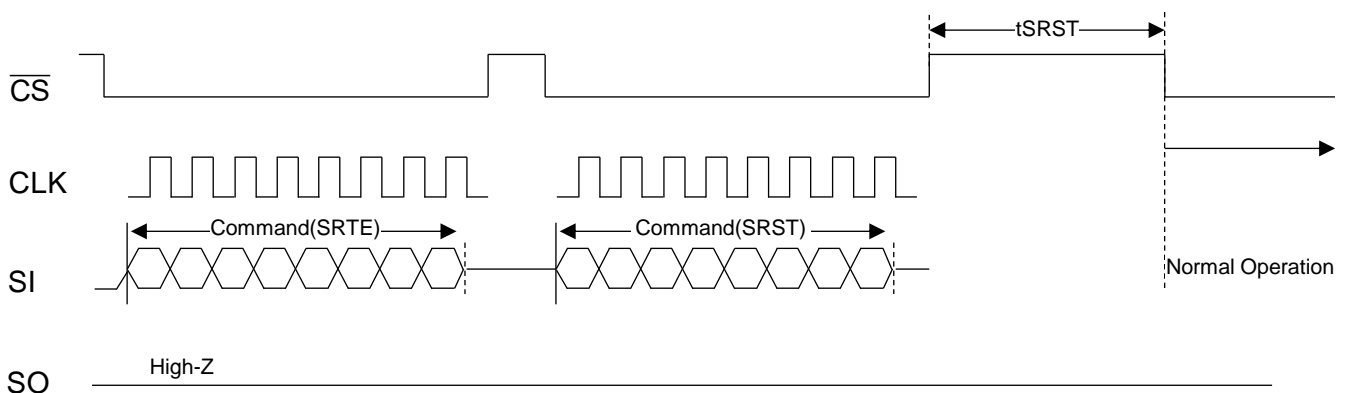

- It requires a delay of  $t_{EXDPD}$  before the device can fully exit the deep power down mode and enter standby mode.
- Status of all non-volatile bits in registers remains unchanged when the device enters or exits the deep power down mode.
- The command can be issued in SPI, DPI, and QPI mode.

## Software Reset

Software Reset (SRST) requires Software Reset Enable (SRTE) implemented in advance.

**Figure 19 : Software Reset Timing**

## Electrical Specifications

### Absolute Maximum Ratings

Stresses greater than those listed may cause permanent damage to the device. This is a stress rating only. Exposure to maximum rating for extended periods may adversely affect reliability.

**Table 30 : Absolute Maximum Ratings**

Parameter	Min.	Max.	Units
Voltage on Vcc Supply Relative to VSS : 3.3V Device	-0.5	3.8	V
Voltage on Any Pin relative to VSS : 3.3V Device	-0.5	3.8	V
Voltage on Vcc Supply Relative to VSS : 1.8V Device	-0.5	2.35	V
Voltage on Any Pin relative to VSS : 1.8V Device	-0.5	2.35	V
Storage Temperature	-55	150	°C
Operating Ambient Temperature	-40	85	°C
ESD HBM (Human Body Model)	≥  2000 V		V
ESD CDM (Charged Device Model)	≥  500 V		V
Solder Reflow Process	JEDEC J-STD-020 reflow profiles - Peak temperature ≤ 260°C - The time above 255°C ≤ 30 seconds - Reflow cycles ≤ 3 times		

### Endurance, Retention and Magnetic Immunity

**Table 31 : Endurance, Retention and Magnetic Immunity**

Parameter	Conditions	Min.	Max.	Units
Write Endurance	-25°C	10 <sup>14</sup>	-	cycles
Data Retention	85°C	10	-	years
Magnetic Field During Write or Read	-	-	24,000	A/m

## Recommended Operating Conditions
